Haloimidazolium-based ionic liquids (ILs) are important materials for many important applications. While recent advances in our understanding of the 1D order of motion (swimming) of imidazolium cations in ILs has expanded our understanding, here we focus on the 2D structure of the electronic structure of these materials. Specifically, we show evidence for strongly cation-centered electronic charges residing close to the walls of the ionic liquid box. Based on the hypothesis that these charges interact via the π orbitals of the imidazolium ring, we determine the density of this charge and show that it is well-spaced from the imidazolium ring.Q: What
